Selected Answer: B

The correct answer is B.

This command updates an existing deployment with the configuration specified in the deployment-config-path file. Deployment Manager automatically determines whether resources need to be created, updated, or deleted in order to apply the changes.

Here is an example of how to use the gcloud deployment-manager deployments update command to update a deployment without any resource downtime:

```
gcloud deployment-manager deployments update my-deployment --config deployment.yaml
```

This command will update the my-deployment deployment with the configuration specified in the deployment.yaml file. Deployment Manager will automatically determine whether resources need to be created, updated, or deleted in order to apply the changes.

Selected Answer: B

The correct answer is Option B: `gcloud deployment-manager deployments update --config <deployment-config-path>`. This command updates an existing deployment with the configuration specified in the `deployment-config-path` file. It allows you to make changes to the deployment without any downtime in the resources.
