EXAM ASSOCIATE CLOUD ENGINEER TOPIC 1 QUESTION 267 DISCUSSION

Actual exam question from Google's Associate Cloud Engineer

Question #: 267

Topic #: 1

[All Associate Cloud Engineer Questions]

You want to deploy a new containerized application into Google Cloud by using a Kubernetes manifest. You want to have full control over the Kubernetes deployment, and at the same time, you want to minimize configuring infrastructure. What should you do?

- A. Deploy the application on GKE Autopilot.

- B. Deploy the application on Cloud Run.

- C. Deploy the application on GKE Standard.

- D. Deploy the application on Cloud Functions.

Autopilot mode is designed for those who prefer a hands-off approach. It's best suited for businesses that want to leverage the power of Kubernetes without diving deep into its intricacies. It offers a simplified, managed experience with Google taking care of the operational overhead.

On the other hand, Standard mode is for those who want granular control over their Kubernetes environment. It's ideal for businesses with specific requirements and those who have the expertise to manage and optimize their Kubernetes clusters.

Despite the managed nature of the infrastructure of a GKE Autopilot Cluster, you still have full control over your Kubernetes workloads, configurations, and deployments. This allows you to use Kubernetes manifests and customize your deployment as needed.
